NationGraph Engineering Interview - Part 1

A small service that turns webpages and files into useful data.

Your Task

We want to scrape CreateTO to gain useful knowledge from the site from the past 5 years.

High Level Information

- Start at CreateTO's homepage.
- Scrape pages from CreateTO as exhaustively as you can
- Find linked files.
- Persist the Scraped Pages as well.
- Create useful data points.
- Save the results in a format another service can use.
- Consider re-running the scraper as the site changes.

Open CreateTO

Data we can use

Keep	What that means
Useful data	Choose fields worth using later, such as a project's **location**, **phase**, or **dates**.
The source/reference	Keep the page or file link. For facts from a file, include a page number or a short supporting excerpt.
The history	Track when data was extracted, consider corrections and amendments to information.

Use any sensible data format. You may extract more than what is mentioned above, these are suggestions.

Useful information

Places to look (examples)

Projects and project details

Parkdale Hub and its project materials

News and the annual report

- Public pages and linked public files only.
- Files may live on another host.
- Log blocked or skipped links and please don’t DDOS the site.

What to send us

Include	What we need
Code and setup	A repo (preferred) or zip, clear run instructions, and an example output. A local service or repeatable command is fine.
Results from two runs	A first run and an unchanged repeat: time, requests, files processed, useful records, paid calls and cost.
Variants	Show an unchanged run, a changed source and a failed file. Saved local copies are fine for these checks.

Label estimated costs. Include model, hosting and other service costs if you use them.
